

ONE SERVER HOSTING DATA BACKUP SOLUTIONS

WWW.ONESERVERHOSTING.COM/BACKUP

One Server Hosting Data Backup is the best choice for anyone needing to ensure that their data is backed up and protected at an off-site location. One Server Hosting Data Backup uses some of the most advanced backup technology available today to allow you to make sure what you need backed up is done both securely and accurately with the least impact to your systems resources. One Server Hosting Data Backup is ideal for customers who have a dedicated server or colocated servers who require a reliable, affordable and secure backup solution. One Server Hosting offers two solutions for data backup at competitive price points that fit any budget.

SIMPLE BACKUP—NETWORK ATTACHED STORAGE

Simple Backup is ideal for those who just want a place to backup and store their most important data in an alternate data center. With Simple Backup you have control of what files get backed up and how often. You are given access credentials and a network address that you can setup as an off site storage drive. You can then utilize your own software or operating system process to backup data to this location. You can also manually backup important files as you need to. Simple Backup empowers you to control every aspect of your backup process. It does not include any administrative assistance for setting up the backup services, but with its easy and intuitive nature any server administrator should have no problem in getting it setup easily and quickly.

CDP BACKUP—CONTINUOUS DATA PROTECTION

Continuous Data Protection (CDP) Backup is intended for customers who want a more comprehensive and managed backup solution for Linux, Windows and SQL. One Server Hosting's CDP Backup solution enables you to designate which directories and files on your hard disks you want backed up. With a CDP Backup solution One Server Hosting administrators will install a custom software component by R1Soft on your server (Windows or Linux), which is designed to backup any modified files (or portions of files) to One Server Hosting's CDP Backup servers. These backups can be run as frequently as hourly, and are very efficient since they only transmit modified portions of the disk in each backup pass.

CDP Backup also allows for multiple "restore points" to be kept, so you are able to roll back your server or restore files as they were one hour ago, one week ago or one month ago!

DATA BACKUP SERVICE PRICING

Simple Backup		What's Included	Set-Up	Monthly
Initial Setup & 10 GB Storage	Consists of network attached storage space accessible through standard file sharing protocols. Allows storage of up to 10 GB of data to a RAID-based backup server		\$10	\$4
10 GB Additional Storage	Additional 10 GB of storage for Simple Backup			\$5
CDP Backup		What's Included	Set-Up	Monthly
Initial Setup & 10 GB Storage	The CDP plugin will backup modified portions of the system on a daily, or even hourly, basis. A bootable CD can be used to perform a bare metal restoration of a damaged server		\$25	\$29.95
10 GB Additional Storage	Additional 10 GB for CDP Backup			\$5
